### Abstract

A series of cationic gold(I)-carbene complexes with various 4,5-diarylimidazolylidene ligands were either newly prepared or repurposed for testing against protozoal *Leishmania major, Toxoplasma gondii,* and *Trypanosoma brucei* parasites. The syntheses of the new complexes **1b** and **1c** were described. Ferrocene compound **1a** showed the highest activities against *L. major* amastigotes and *T. gondii* and distinct selectivity for *T. gondii* cells when compared with the activity against nonmalignant Vero cells. The ferrocene derivatives **1a-c** are generally more active against the *L. major* amastigotes and the *T. gondii* tachyzoites than the other tested anisyl gold complexes and the approved drugs atovaquone and amphotericin B. Compounds **1a** and **1e** showed the highest selectivities for *L. major* amastigotes. Compounds **1d** and **1f** showed the highest selectivities for *L. major* promastigotes; **1f** was the most active compound against *L. major* promastigotes of this series of compounds. The 3,4,5-trimethoxyphenyl analog **1b** also exhibited a much greater selectivity for *T. b. brucei* cells when compared with its activity against human HeLa cells.

### KEYWORDS

antiparasitic drugs, gold, metal-based drugs, neglected tropical diseases, N-heterocyclic carbene

### 1 | INTRODUCTION

New, efficient drugs for the treatment of parasitic diseases are sought-after, and numerous efforts to identify antiparasitic drugs against neglected tropical diseases (NTDs) are already being made. Both locals and travelers in tropical and subtropical countries are in danger of infection by NTDs, which will likely spread to further regions in the near future due to the ongoing climate change. [2]

Metal-based drugs have been approved for the therapy of many diseases and represent a prospering field of drug design. The gold complex auranofin is a prominent example that is applied for the treatment of rheumatoid arthritis. Gold complexes with antiparasitic

activities have also been disclosed.<sup>[5]</sup> The X-ray structure of auranofin bound to *Leishmania infantum* trypanothione reductase revealed a dual mode of inhibition by this drug.<sup>[6]</sup> In addition, there is a continuously growing number of gold N-heterocyclic carbene (NHC) complexes with potent biological effects, including anticancer and antiparasitic activities.<sup>[7]</sup> Mechanistically, gold-carbene complexes can inhibit thioredoxin reductase or interact with DNA (e.g., with DNA G quadruplexes).<sup>[8-11]</sup> The high antitrypanosomal and parasite cytoskeleton-damaging activities of cationic gold(I)-NHC complexes, such as **1a**, were reported previously.<sup>[12]</sup> Complex **1a** was found to be distinctly more active against *Trypanosoma brucei* cells than against human cells, including cancer cells. These antiparasitic effects are not surprising as other

ferrocene derivatives have previously shown activities against various parasites. [13–15] In addition, imidazoles, on their own, also displayed distinct antimicrobial and antiparasitic activities. [16,17] We now evaluated the scope and structure dependence of the antiparasitic effects of a series of known and new gold(I)–NHC complexes of our lab on the protozoal parasites *Leishmania major*, *T. brucei* (both kinetoplastid parasites), and *Toxoplasma gondii* (apicomplexan parasite). Some of the known gold complexes used in this study have already shown in vivo activity against tumor xenografts with good tolerability by the laboratory animals and, thus, these complexes are suitable for repurposing against parasites. [18,19]

### 2 | RESULTS AND DISCUSSION

The known complexes  ${\bf 1a}$  and  ${\bf 1d-g}$  were prepared according to literature procedures (Figure 1). [18,19] The new complexes  ${\bf 1b}$  and  ${\bf 1c}$  were prepared accordingly and tested to assess the influence of methoxy substituents on the activity against and the selectivity for protozoal parasites (Scheme 1). The reaction of ferrocenecarboxaldehyde with ethyl amine and TosMIC reagents  ${\bf 2b}$  and  ${\bf 2c}$ , respectively, afforded the N-ethyl-imidazoles  ${\bf 3b}$  and  ${\bf 3c}$  in good yields. High yield alkylation with ethyl iodide was followed by quantitative conversion of the iodides  ${\bf 4b}$  and  ${\bf 4c}$  to the BF<sub>4</sub> salts  ${\bf 5b}$  and  ${\bf 5c}$ . Finally, reaction of  ${\bf 5b}$  and  ${\bf 5c}$  with Ag<sub>2</sub>O and transmetallation with 0.5 equiv.

**SCHEME 1** Synthesis of the target compounds. Reagents and conditions: (i) Ferrocenecarboxaldehyde, EtNH $_2$  (2 M in THF), AcOH, EtOH, reflux, 1 hr, then K $_2$ CO $_3$ , EtOH, reflux, 2 hr, 74–79%; (ii) EtI, MeCN, 85°C, 24 hr, 97–100%; (iii) NaBF $_4$ , acetone, rt, 24 hr, 100%; (iv) Ag $_2$ O, CH $_2$ CI $_2$ /MeOH (1:1), rt, 5 hr, then Au(DMS)CI, CH $_2$ CI $_2$ /MeOH (1:1), rt, 24 hr, 71–79%

Au(DMS)CI led to the target complexes **1b** and **1c** as brown solids in good yields.

The complexes **1a-g** (Figure 1) were initially tested for their activity against *T. gondii* tachyzoites (Table 1). The ferrocene derivatives **1a-c** showed distinctly higher activities against *T. gondii* (EC<sub>50</sub> =  $0.013-0.046\,\mu\text{M}$ ) than the anisyl derivatives **1d-g** (EC<sub>50</sub> =  $0.116-0.678\,\mu\text{M}$ ). Complex **1a** exhibited the highest activity of all test compounds. The ferrocenes **1a-c** also showed a reasonable selectivity for *T. gondii* cells (best for **1a**, selectivity index [SI] = 28.1) versus

experiments ± standard deviation. They were derived from concentration–response curves obtained by measuring the percentage of vital cells relative to untreated controls after 72 hr.

 $^{b}$ Selectivity index (SI; IC $_{50}$ /EC $_{50}$ ) calculated from the corresponding IC $_{50}$  values for the Vero cells and the EC $_{50}$  values against T. gondii.

nonmalignant Vero cells. Among the anisyl complexes 1d-g, the *N*-ethyl 3,4,5-trimehoxyphenyl derivative 1e is more selective than the analogous *N*-methyl derivative 1d, indicating an influence by the *N*-alkyl group. Such an influence was not observed for the 3-halo-4,5-dimethoxyphenyl derivatives 1f and 1g. Compounds 1a-c were also more active than the positive control atovaquone (ATO), which is an approved drug for the treatment of toxoplasmosis.

The activity of complexes **1a-g** against *L. major* promastigotes and amastigotes was also determined (Table 2). The ferrocenes **1a-c** 

were the most efficient growth inhibitors of the L. major amastigotes with complex 1a showing the highest activity (EC<sub>50</sub> =  $0.11 \,\mu\text{M}$ ) and a slight selectivity for the amastigotes (SI = 3.32). However, anisyl-NHC complex 1e, while being the second least active compound against amastigotes, showed the highest selectivity for them (SI = 12.8). The anisyl-NHC complexes 1d and 1f were slightly more active than the ferrocenes against L. major promastigotes and less active against the amastigotes. For approved antileishmanial drugs, a high activity against amastigotes was observed and other drug candidates also showed higher activity against L. major amastigotes than against promastigotes.<sup>[20,21]</sup> When compared with the positive control amphotericin B (AmB), complexes 1a-d showed higher activities both against the promastigotes and against the amastigotes. In addition, compound 1f was more active than AmB against the promastigotes, and 1g against the amastigotes. Complex 1e showed virtually the same activity as AmB against amastigotes and considerable selectivity

Compounds **1a** and **1e** were already described by our groups as antitrypanosomal compounds. [12] Hence, the new ferrocenes **1b** and **1c**, which are close analogs of **1a**, were selected and also tested for their trypanocidal activity against bloodstream-form *T. b. brucei* parasites by the Alamar Blue (AB) assay. The obtained results were compared with those previously observed for **1a** and **1e** (Table 3). [12] In particular, the new complex **1b** exhibited high activity against *T. b. brucei* (IC<sub>50</sub> = 5 nM) and a high selectivity for *T. b. brucei* cells versus human HeLa cervix carcinoma cells. The selectivity of **1b** (SI = 168) for *T. b. brucei* exceeded even those of **1a** (SI = 148) and the 4-anisyl-5-(3,4,5-trimethoxyphenyl)-imidazol-2-ylidene complex **1e**. Among the new ferrocenes, the 3,4,5-trimethoxyphenyl group of **1b** proved to be more conducive to overall activity against and selectivity for the parasite than the anisyl group of **1c**.

### 3 | CONCLUSIONS

The evaluation of a series of NHC gold(I) complexes against pathogenic parasites such as T. gondii, T. b. brucei and L. major led to promising results. Both high activities and considerable selectivities were observed. The ferrocene derivatives 1a and 1b, in particular, were highly active against all tested parasites. The anisyl-NHC derivatives 1d and 1f exhibited remarkable activities against L. major promastigotes, which is worthy of note as most of the other tested complexes were more active against L. major amastigotes, which is also more typical of established antileishmanial drugs and drug candidates currently in the pipeline. More research into the mechanisms of action and their structure-activity dependencies is necessary to pinpoint the reason for these peculiar differences. According to present knowledge, investigational applications of some of the tested gold complexes for the treatment of cutaneous leishmaniasis (i.e., L. major infection) appear promising, as do their combinations with approved antiparasitic drugs such as pentamidine or miltefosine to reduce the necessary doses and possible side-effects.

### 4 | EXPERIMENTAL

### 4.1 | Chemistry

### 4.1.1 | General

All starting compounds were purchased from Aldrich. The known complexes **1a** and **1d-g** and the TosMIC reagents **2b** and **2c** were prepared according to literature procedures. [18,19,22] The analytical data of these compounds were in agreement with the published data. The following instruments were applied for this study: melting points (uncorrected), Gallenkamp; infrared (IR) spectra, Perkin-Elmer Spectrum One FT-IR spectrophotometer with ATR-sampling unit;

nuclear magnetic resonance spectra, Bruker Avance 300 spectrometer; chemical shifts are given in parts per million ( $\delta$ ) downfield from tetramethylsilane as internal standard; mass spectra, Varian MAT 311A (EI), UPLC/Orbitrap (ESI); microanalyses, Perkin-Elmer 2400 CHN elemental analyzer.

The compound codes together with the nuclear magnetic resonance (NMR) spectra of the new compounds **1b** and **1c** are provided as Supporting Information.

1-Ethyl-5-ferrocenyl-4-(3,4,5-trimethoxyphenyl)-imidazole (3b)

Ferrocenecarboxaldehyde (90 mg, 0.42 mmol) was dissolved in EtOH and EtNH<sub>2</sub> (2 M in THF, 1.05 ml, 2.10 mmol) and AcOH (150 µl, 2.63 mmol) were added. The reaction mixture was stirred under reflux for 1 hr. Compound 2b (159 mg, 0.44 mmol) and K<sub>2</sub>CO<sub>3</sub> (500 mg, 3.62 mmol) were added, and the reaction mixture was stirred under reflux for 2 hr. The solvent was evaporated, and the residue was suspended in ethyl acetate, washed with water, dried over Na<sub>2</sub>SO<sub>4</sub>, filtered, and the filtrate was concentrated in vacuum. The residue was purified by column chromatography (silica gel 60, ethyl acetate/ methanol 9:1). Yield: 138 mg (0.31 mmol, 74%); brown oil;  $\nu_{\text{max}}(ATR)/cm$ 3,087, 3,004, 2,958, 2,931, 2,831, 1,585, 1,511, 1,459, 1,432, 1,413, 1,390, 1,354, 1,344, 1,286, 1,235, 1,198, 1,185, 1,124, 1,062, 1,033, 1,010, 959, 885, 842, 818, 770, 743, 732, 697, 664, 651, 641, and 626; <sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>)  $\delta$  1.58 (3H, t, J = 7.3 Hz, CH<sub>3</sub>), 3.75 (6H, s, 2 × OCH<sub>3</sub>), 3.83 (3H, s, OCH<sub>3</sub>), 4.0-4.1 (5H, m, Fc-H), 4.2-4.3 (4H, m, Fc-H), 4.51 (2H, q, J = 7.3 Hz, CH<sub>2</sub>), 6.69 (2H, s, Ar-H), and 7.59 (1H, s, imidazole-H);  $^{13}$ C NMR (75.5 MHz, CDCl<sub>3</sub>)  $\delta$  17.1 (CH<sub>3</sub>), 39.8 (CH<sub>2</sub>), 56.0 (OCH<sub>3</sub>), 60.9 (OCH<sub>3</sub>), 66.6, 68.2, 69.2, 75.4 (Fc-C), 105.8, 113.2, 124.1, 130.4, 131.0, 136.1, 136.6, 136.9, 140.1 (Ar-C or imidazole-C), 152.7 (Ar-COCH<sub>3</sub>), and 153.2 (Ar-COCH<sub>3</sub>); m/z (%) 447 (82) [M<sup>+</sup>], 446 (100) [M<sup>+</sup>], 415 (7), 381 (38), 294 (13), 252 (15), 121 (23), and 56 (14).

### 1-Ethyl-4-anisyl-5-ferrocenylimidazole (3c)

Ferrocenecarboxaldehyde (90 mg, 0.42 mmol) was dissolved in EtOH and  $EtNH_2$  (2 M in THF, 1.05 ml, 2.10 mmol) and AcOH (150  $\mu$ l, 2.63 mmol) were added. The reaction mixture was stirred under reflux for 1 hr. Compound 2c (133 mg, 0.44 mmol) and K<sub>2</sub>CO<sub>3</sub> (500 mg, 3.62 mmol) were added and the reaction mixture was stirred under reflux for 2 hr. The solvent was evaporated and the residue was suspended in ethyl acetate, washed with water, dried over Na2SO4, filtered, and the filtrate was concentrated in vacuum. The residue was purified by column chromatography (silica gel 60, ethyl acetate/methanol 9:1). Yield: 128 mg (0.33 mmol, 79%); brown oil;  $\nu_{\text{max}}(ATR)/\text{cm}$  3,093, 2,973, 2,935, 2,835, 1,613, 1,577, 1,562, 1,516, 1,456, 1,412, 1,378, 1,350, 1,290, 1,242, 1,199, 1,173, 1,105, 1,030, 1,001, 949, 876, 832, 744, 723, 707, 663, 635, and 600; <sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>)  $\delta$  1.54 (3H, t, J = 7.3 Hz, CH<sub>3</sub>), 3.80 (3H, s, OCH<sub>3</sub>), 4.0-4.1 (5H, m, Fc-H), 4.2-4.3 (4H, m, Fc-H), 4.45 (2H, q, J = 7.3 Hz, CH<sub>2</sub>), 6.84 (2H, d, J = 8.9 Hz, Ar-H), 7.39 (2H, d,J = 8.9 Hz, Ar-H), and 7.58 (1H, s, imidazole-H);  $^{13}\text{C}$  NMR (75.5 MHz, CDCl<sub>3</sub>) δ 17.0 (CH<sub>3</sub>), 40.0 (CH<sub>2</sub>), 60.4 (OCH<sub>3</sub>), 68.1, 68.9, 69.1, 75.7 (Fc-C), 113.3, 113.8, 123.6, 127.6, 128.4, 128.8, 130.0, 132.1, 136.1, 136.3, 140.0 (Ar-C or imidazole-C), 158.5 (Ar-COCH<sub>3</sub>); m/z (%) 386 (100) [M<sup>+</sup>], 321 (47), 308 (47), 264 (22), 193 (26), 121 (31), and 56 (21).

 $<sup>^{</sup>b}$ Selectivity index (SI) calculated from the corresponding IC $_{50}$  values for the HeLa cells and the IC $_{50}$  values for *T. b. brucei*.

### 1,3-Diethyl-4-ferrocenyl-5-(3,4,5-trimethoxyphenyl)-imidazolium iodide (4b)

Compound 3b (130 mg, 0.29 mmol) was dissolved in MeCN (15 ml) and iodoethane (1.0 ml, 12.4 mmol) was added. The reaction mixture was stirred at 85°C for 24 hr. The solvent was evaporated and the residue was dried in vacuum. Yield: 170 mg (0.28 mmol, 97%); brown oil;  $\nu_{\text{max}}$ (ATR)/cm 3,133, 3,037, 2,975, 2,937, 2,835, 1,580, 1,566, 1,510, 1.488, 1.463, 1.444, 1.429, 1.412, 1.390, 1.353, 1.343, 1.294, 1.238, 1,196, 1,159, 1,122, 1,087, 1,060, 1,032, 1,021, 1,001, 962, 918, 887, 840, 826, 816, 800, 777, 727, 674, 663, 623, and 600; <sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>)  $\delta$  1.49 (3H, t, J = 7.3 Hz, CH<sub>3</sub>), 1.76 (3H, t, J = 7.3 Hz, CH<sub>3</sub>), 3.83 (6H, s, 2 × OCH<sub>3</sub>), 3.92 (3H, s, OCH<sub>3</sub>), 4.0-4.1 (5H, m, Fc-H), 4.1-4.2 (2H, m, Fc-H), 4.20 (2H, q, J = 7.3 Hz, CH<sub>2</sub>), 4.3-4.4 (2H, m, Fc-H), 4.72 (2H, q, J = 7.3 Hz, CH<sub>2</sub>), 6.53 (2H, s, Ar–H), and 10.30 (1H, s, imidazolium–H); <sup>13</sup>C NMR (75.5 MHz, CDCl<sub>3</sub>) δ 15.9 (CH<sub>3</sub>), 16.5 (CH<sub>3</sub>), 43.4 (CH<sub>2</sub>), 56.6 (OCH<sub>3</sub>), 61.1 (OCH<sub>3</sub>), 67.3, 68.7, 69.3, 69.7, 69.8, 70.0, 70.4, 80.3 (Fc-C), 106.3, 108.3, 120.9, 129.7, 130.1, 130.2, 135.7, 138.0, 140.0 (Ar-C or imidazolium-C), 154.0 (Ar-COCH<sub>3</sub>), and 154.4 (Ar-COCH<sub>3</sub>); m/z (%) 474 (2) [M<sup>+</sup>], 445 (18), 142 (42), 127 (21), and 66 (100).

### 1,3-Diethyl-4-anisyl-5-ferrocenylimidazolium iodide (4c)

Compound 3c (127 mg, 0.33 mmol) was dissolved in MeCN (15 ml) and iodoethane (1.0 ml, 12.4 mmol) was added. The reaction mixture was stirred at 85°C for 24 hr. The solvent was evaporated and the residue was dried in vacuum. Yield: 179 mg (0.33 mmol, 100%); brown oil;  $\nu_{\text{max}}$ (ATR)/cm 3,439, 2,977, 2,934, 2,837, 1,616, 1,599, 1,562, 1,519, 1,487, 1,455, 1,411, 1,386, 1,343, 1,292, 1,249, 1,175, 1,106, 1,022, 1,006, 963, 919, 883, 838, 768, 724, 639, 626, and 616; <sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>)  $\delta$  1.40 (3H, t, J = 7.3 Hz, CH<sub>3</sub>), 1.71 (3H, t, J = 7.3 Hz, CH<sub>3</sub>), 3.84 (3H, s, OCH<sub>3</sub>), 3.92 (3H, s, OCH<sub>3</sub>), 3.9-4.0 (5H, m, Fc-H), 4.0-4.1 (4H, m, Fc-H), 4.2-4.3 (2H, m, CH<sub>2</sub>), 4.66 (2H, q, J = 7.3 Hz,  $CH_2$ ), 7.01 (2H, d, J = 8.9 Hz, Ar-H), 7.23 (2H, d, J = 8.9 Hz, Ar-H), and 10.23 (1H, s, imidazolium-H);  $^{13}$ C NMR (75.5 MHz, CDCl<sub>3</sub>)  $\delta$  15.6 (CH<sub>3</sub>), 16.3 (CH<sub>3</sub>), 43.1 (CH<sub>2</sub>), 43.4 (CH<sub>2</sub>), 55.4 (OCH<sub>3</sub>), 67.3, 68.7, 69.2, 69.5, 69.6, 70.1, 80.3 (Fc-C), 106.5, 114.6, 115.1, 117.6, 130.0, 130.1, 131.6, 131.8, 132.4, 135.4, 137.9, 147.0 (Ar-C or imidazolium-C), and 161.2 (Ar-COCH<sub>3</sub>); m/z (%) 415 (53) [M<sup>+</sup>], 401 (60), 387 (100), 373 (55), 348 (35), 309 (27), 186 (72), 142 (37), 121 (34), and 66 (78).

### 1,3-Diethyl-4-ferrocenyl-5-(3,4,5-trimethoxyphenyl)-imidazolium tetrafluoroborate (*5b*)

Compound **4b** (170 mg, 0.28 mmol) was dissolved in acetone (15 ml) and NaBF<sub>4</sub> (47 mg, 0.43 mmol) was added. The reaction mixture was stirred at room temperature for 24 hr. The solution was filtered over MgSO<sub>4</sub>, the filtrate was concentrated and dried in vacuum. Yield: 157 mg (0.28 mmol, 100%); brown oil;  $\nu_{\text{max}}(\text{ATR})/\text{cm}$  2,987, 2,928, 2,828, 1,583, 1,568, 1,511, 1,489, 1,458, 1,428, 1,412, 1,393, 1,351, 1,296, 1,240, 1,197, 1,164, 1,124, 1,107, 1,032, 1,010, 921, 889, 858, 825, 778, 727, 675, 642, and 627;  $^{1}\text{H}$  NMR (300 MHz, CDCl<sub>3</sub>)  $\delta$  1.47 (3H, t, J = 7.3 Hz, CH<sub>3</sub>), 1.74 (3H, t, J = 7.3 Hz, CH<sub>3</sub>), 3.81 (6H, s, 2 × OCH<sub>3</sub>), 3.89 (3H, s, OCH<sub>3</sub>), 4.0–4.1 (5H, m, Fc–H), 4.1–4.2 (4H, m, Fc–H), 4.3–4.4 (2H, m, CH<sub>2</sub>), 4.70 (2H, q, J = 7.3 Hz, CH<sub>2</sub>), 6.54 (2H, s, Ar–H), and 10.18 (1H, s, imidazolium–H);  $^{13}\text{C}$  NMR (75.5 MHz,

CDCl<sub>3</sub>)  $\delta$  15.8 (CH<sub>3</sub>), 16.4 (CH<sub>3</sub>), 43.4 (CH<sub>2</sub>), 56.6 (OCH<sub>3</sub>), 61.0 (OCH<sub>3</sub>), 67.3, 68.6, 69.2, 69.6, 70.0, 70.3 (Fc-H), 106.4, 108.3, 120.9, 130.0, 130.1, 135.4, 137.8, 139.8 (Ar-C or imidazolium-C), 153.8 (Ar-COCH<sub>3</sub>), and 154.1 (Ar-COCH<sub>3</sub>).

1,3-Diethyl-4-anisyl-5-ferrocenylimidazolium tetrafluoroborate (5c) Compound 4c (166 mg, 0.31 mmol) was dissolved in acetone (15 ml) and NaBF<sub>4</sub> (51 mg, 0.47 mmol) was added. The reaction mixture was stirred at room temperature for 24 hr. The solution was filtered over MgSO<sub>4</sub>, the filtrate was concentrated and dried in vacuum. Yield: 156 mg (0.31 mmol, 100%); brown oil;  $\nu_{\text{max}}(ATR)/\text{cm}$  3,417, 2,976, 2,935, 2,836, 1,616, 1,599, 1,562, 1,519, 1,487, 1,456, 1,411, 1,386, 1,343, 1,292, 1,249, 1,175, 1,106, 1,022, 1,006, 963, 919, 883, 838, 768, 724, 639, and 615;  ${}^{1}$ H NMR (300 MHz, CDCl<sub>3</sub>)  $\delta$  1.39 (3H, t, J = 7.3 Hz, CH<sub>3</sub>), 1.71 (3H, t, J = 7.3 Hz, CH<sub>3</sub>), 3.84 (3H, s, OCH<sub>3</sub>), 3.9-4.0 (5H, m, Fc-H), 4.0-4.1 (4H, m, Fc-H), 4.2-4.3 (2H, m, CH<sub>2</sub>), 4.65 (2H, q, J = 7.3 Hz, CH<sub>2</sub>), 7.01 (2H, d, J = 8.9 Hz, Ar-H), 7.23 (2H, d,  $J = 8.9 \,\text{Hz}$ , Ar-H), and 10.19 (1H, s, imidazolium-H); <sup>13</sup>C NMR  $(75.5 \text{ MHz}, \text{CDCl}_3) \delta 15.6 (\text{CH}_3), 16.3 (\text{CH}_3), 43.0 (\text{CH}_3), 43.4 (\text{CH}_3),$ 55.5 (OCH<sub>3</sub>), 67.3, 68.7, 69.2, 69.3, 69.5, 69.6, 70.1, 80.4 (Fc-H), 106.5, 114.6, 115.1, 117.6, 130.0, 130.1, 131.6, 131.8, 132.0. 132.4, 135.3, 137.9 (Ar-C or imidazolium-C), and 161.3 (Ar-COCH<sub>3</sub>).

### Bis-[1,3-diethyl-4-ferrocenyl-5-(3,4,5-trimethoxyphenyl)-imidazol-2-ylidene]gold(I) (1b)

Compound 5b (157 mg, 0.28 mmol) was dissolved in CH<sub>2</sub>Cl<sub>2</sub>/MeOH (1:1, 30 ml) and Ag<sub>2</sub>O (108 mg, 0.47 mmol) was added. The reaction mixture was stirred at room temperature for 5 hr. Au(DMS)CI (41 mg, 0.14 mmol) was added and the reaction mixture was stirred at room temperature for 24 hr. The suspension was filtered, the filtrate was concentrated in vacuum and the residue was redissolved in CH<sub>2</sub>Cl<sub>2</sub>, filtered over MgSO<sub>4</sub>/celite. The filtrate was concentrated and the remainder was recrystallized from CH2Cl2/n-hexane and dried in vacuum. Yield: 136 mg (0.11 mmol, 79%); brown solid of mp 176-178°C;  $\nu_{\text{max}}(ATR)/\text{cm}$  2,933, 1,580, 1,509, 1,460, 1,411, 1,346, 1,327, 1,287, 1,236, 1,185, 1,165, 1,124, 1,107, 1,047, 1,030, 1,002, 916, 886, 822, 779, 727, and 670; <sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>)  $\delta$  1.3-1.5 (6H, m, 2 × CH<sub>3</sub>), 1.6-1.8 (6H, m, 2 × CH<sub>3</sub>), 3.83 (12H, s, 4 × OCH<sub>3</sub>), 3.9-4.0 (6H, m, 2 × OCH<sub>3</sub>), 4.0-4.3 (22H, m, Fc-H,  $2 \times CH_2$ ), 4.6-4.7 (4H, m,  $2 \times CH_2$ ), and 6.51 (4H, s, Ar-H); <sup>13</sup>C NMR (75.5 MHz, CDCl<sub>3</sub>)  $\delta$  17.7 (CH<sub>3</sub>), 18.2 (CH<sub>3</sub>), 44.1 (CH<sub>2</sub>), 44.3 (CH<sub>2</sub>), 56.5 (OCH<sub>3</sub>), 61.0 (OCH<sub>3</sub>), 65.1, 68.4, 69.1, 69.2, 69.5, 72.4 (Fc-H), 108.1, 108.4, 123.6, 128.7, 129.2, 130.5 (Ar-C or imidazolium-C), 149.9 (Ar-COCH<sub>3</sub>), 153.6 (Ar-COCH<sub>3</sub>), and 182.8 (Au-C); m/z (ESI, %) 1,145.0 (80) [M<sup>+</sup>] and 475.2 (100). Anal calcd. C<sub>52</sub>H<sub>60</sub>AuBF<sub>4</sub>Fe<sub>2</sub>N<sub>4</sub>O<sub>6</sub>: C, 50.67; H, 4.91; N, 4.55; Found, C, 50.79; H, 4.99; N, 4.60%.

### Bis-[1,3-diethyl-4-anisyl-5-ferrocenylimidazol-2-ylidene]gold(I) (1c)

Compound 5c (156 mg, 0.31 mmol) was dissolved in  $CH_2Cl_2/MeOH$  (1:1, 20 ml) and  $Ag_2O$  (120 mg, 0.52 mmol) was added. The reaction mixture was stirred at room temperature for 5 hr. Au(DMS)Cl (45 mg, 0.16 mmol) was added and the reaction mixture was stirred at room

temperature for 24 hr. The suspension was filtered, the filtrate was concentrated in vacuum and the residue was redissolved in CH<sub>2</sub>Cl<sub>2</sub>, filtered over MgSO<sub>4</sub>/celite. The filtrate was concentrated and the remainder was recrystallized from CH<sub>2</sub>Cl<sub>2</sub>/n-hexane and dried in vacuum. Yield: 127 mg (0.114 mmol, 71%); brown solid of mp 190-193°C;  $\nu_{\text{max}}(\text{ATR})/\text{cm}$  2,960, 2,933, 2,872, 2,841, 1,621, 1,599, 1,573, 1,517, 1,462, 1,414, 1,380, 1,346, 1,306, 1,290, 1,250, 1,177, 1.106, 1.046, 1.027, 970, 913, 885, 837, 815, 790, 773, 727, and 645; <sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>)  $\delta$  1.3–1.4 (6H, m, 2 × CH<sub>3</sub>), 1.6–1.7 (6H, m, 2 × CH<sub>3</sub>), 3.88 (6H, s, 2 × OCH<sub>3</sub>), 4.0 -4.1 (10H, m, Fc-H), 4.1-4.2 (8H, m, Fc-H), 4.2-4.3 (4H, m,  $2 \times CH_2$ ), 4.69 (4H, q, J = 7.3 Hz,  $2 \times CH_2$ ), 7.03(4H. d. J = 8.8 Hz. Ar-H), and 7.2-7.3 (4H. m. Ar-H):  $^{13}$ C NMR (75.5 MHz, CDCl<sub>3</sub>) δ 17.3 (CH<sub>3</sub>), 18.2 (CH<sub>3</sub>), 44.1 (CH<sub>2</sub>), 55.4 (OCH<sub>3</sub>), 67.0, 68.4, 69.1, 69.2, 69.4, 69.7, 72.5, 81.5 (Fc-C), 109.0, 114.4, 114.7, 114.9, 119.4, 120.3, 128.8, 130.0, 130.4, 131.5, 131.8, 132.0, 132.4, 134.6 (Ar-C or imidazolium-C, 160.7 (Ar-COCH<sub>3</sub>), and 182.3 (Au-C); m/z (ESI, %) 1,025.0 (100) [M<sup>+</sup>], 946.9 (45), and 506.6 (25). ### 4.2 | Biological assays

## 4.2.1 | *Leishmania major* cell isolation, culture conditions, and assays

Promastigotes of L. major were isolated from a Saudi male patient in February 2016 and maintained at 26°C in Schneider's Drosophila medium (Invitrogen) supplemented with 10% heat-inactivated fetal bovine serum (FBS; Invitrogen) and antibiotics in a tissue culture flask with weekly transfers. Promastigotes were cryopreserved in liquid nitrogen at concentrations of 3 × 10<sup>6</sup> parasite/ml. The virulence of L. major parasites was maintained by passing in female BALB/c mice by injecting hind footpads with  $1 \times 10^6$  stationary-phase promastigotes. After 8 weeks, L. major amastigotes were isolated from mice. Isolated amastigotes were transformed to promastigote forms by culturing at 26°C in Schneider's medium supplemented with 10% FBS and antibiotics. For infection, amastigote-derived promastigotes with less than five in vitro passages were used. Male and female BALB/c mice were obtained from Pharmaceutical College, King Saud University, Kingdom of Saudi Arabia, and maintained in specific pathogen-free facilities.

To evaluate the activity of test compounds against *L. major* promastigotes, promastigotes from logarithmic-phase cultured in phenol red-free RPMI-1640 medium (Invitrogen) with 10% FBS were suspended on 96-wells plates to yield  $10^6$  cells/ml ( $200\,\mu$ I/well) after hemocytometer counting. Compounds were added to obtain the final concentrations (50, 25, 12.5, 6.25, 3.13, 1.65, and  $0.75\,\mu$ g/ml). Negative control wells containing cultures with dimethyl sulfoxide (DMSO; 1%) and without compound and positive control wells containing cultures with decreasing concentration of AmB (reference compound, 50, 25, 12.5, 6.25, 3.13, 1.65,  $0.75\,\mu$ g/ml) were used. Plates were incubated at  $26^{\circ}$ C for  $72\,\text{hr}$  to evaluate the antiproliferative effect. The number of

viable promastigotes were assessed by colorimetric method using the tetrazolium salt colorimetric assay (3-[4,5-dimethylthiazol-2-yl]-2,5-diphenyltetrazolium bromide, MTT). It measures the reduction of the MTT component into an insoluble formazan product. This colored product was solubilized by adding a detergent solution to lyse the cells. The samples were analyzed using an enzyme-linked immunosorbent assay reader at 570 nm. Obtained EC50 values resulted from three independent experiments.  $^{[23]}$ 

To evaluate the activity of test compounds against amastigotes in macrophages, peritoneal macrophages from female BALB/c mice (6-8) weeks of age) were collected by aspiration, then  $5 \times 10^4$  cells per well were seeded on 96-wells plates in phenol red-free Roswell Park Memorial Institute-1640 (RPMI-1640) medium with 10% FBS for 4 hr at 37°C in 5% CO<sub>2</sub> atmosphere to promote cell adhesion. The medium was discarded and washed with phosphate-buffered saline (PBS). 200 µl containing L. major promastigotes solution (at a ratio of 10 promastigotes to 1 macrophage in RPMI-1640 medium with 10% FBS) was added per well. Plates were incubated for 24 hr at 37°C in a humidified 5% CO<sub>2</sub> atmosphere to allow infection and amastigote differentiation. Then, the infected macrophages were washed three times with PBS to remove the free promastigotes and overlaid with fresh phenol red-free RPMI-1640 medium containing compounds at final concentrations (50, 25, 12.5, 6.25, 3.13, 1.65, and 0.75 µg/ml) were added and cells were incubated at 37°C in humidified 5% CO<sub>2</sub> atmosphere for 72 hr. Negative control containing cultures with DMSO (1%) and without compounds and positive control wells containing cultures with decreasing concentration of AmB (reference compound, 50, 25, 12.5, 6.25, 3.13, 1.65, and 0.75 µg/ml) were used. The percentage of infected macrophages were evaluated microscopically after removing medium, washing, fixation, and Giemsa staining. Obtained EC<sub>50</sub> values resulted from three independent experiments (for the EC<sub>50</sub> calculation see Section 4.2.2.).<sup>[23]</sup>

### 4.2.2 | *Toxoplasma gondii* cell line, culture conditions, and assav

Serial passages of the cell line Vero (ATCC® CCL81™) were used for the cultivation of *T. gondii* tachyzoites of the RH strain (a gift from Dr. Saeed El-Ashram, State Key Laboratory for Agrobiotechnology, China Agricultural University, Beijing, China). Vero cells were cultured by using a complete RPMI-1640 medium with heat-inactivated 10% FBS in a humidified 5% CO $_2$  atmosphere at 37°C. For the cultivation of the Vero cells, 96-well plates ( $5 \times 10^3$  cells per well in 200 µl RPMI-1640 medium) were used and then the cells were incubated at 37°C and 5% CO $_2$  for 1 day, followed by removal of medium and washing the cells with PBS. Then, RPMI-1640 medium with 2% FBS containing tachyzoites (RH strain) of *T. gondii* at a ratio of 5 (parasite) to 1 (Vero cells) was added. After incubation at 37°C and 5% CO $_2$  for 5 hr, cells were washed with PBS and then treated as described below.

Negative control (control): Wells containing cultures with DMSO (1%) without test compound.

Experimental: Medium + compounds (dissolved in DMSO) (50, 25, 12.5, 6.25, 3.13, 1.65, and 0.75 µg/ml).

Positive control (reference drug): Medium+ATO (dissolved in DMSO; 50, 25, 12.5, 6.25, 3.13, 1.65, and  $0.75 \mu g/ml$ ).

After incubation at  $37^{\circ}\text{C}$  and 5% CO $_2$  for  $72\,\text{hr}$ , the cells were stained with 1% toluidine blue after washing with PBS and fixation in 10% formalin. The cells were examined under an inverted photomicroscope to determine the infection index (number of cells infected from 200 cells tested) of T. gondii. The following equation was used for the calculation of the observed inhibition (in %):

Inhibition(%) = 
$$(I_{Control} - I_{Experimental})/(I_{Control}) \times 100$$
,

where  $I_{\text{Control}}$  refers to the infection index of untreated cells and  $I_{\text{Experimental}}$  refers to the infection index of cells treated with test compounds.

Then effects of test compounds on parasite growth were expressed as  $EC_{50}$  (effective concentration at 50%) values. Obtained  $EC_{50}$  values resulted from three independent experiments.<sup>[24]</sup>

### 4.2.3 | Trypanosoma cell line and culture conditions

Cultivation of the *T. b. brucei* bloodstream-form cell strain Lister 427 was carried out in HMI-9 medium, pH 7.5, supplemented with 10% FBS at 37°C in a humidified 5%  $CO_2$  atmosphere.<sup>[25]</sup>

### 4.2.4 | Alamar Blue (AB) assay

Viable cells after treatment with drug candidates were identified via the AB assay. [26-29] Pink resorufin is formed in intact cells from the irreversible reaction of the blue dye resazurin and NADH. *T. b. brucei* cells (8,000/well) were seeded on 96-well microplates, test compounds (dissolved in DMSO) were added and the cells were incubated for 72 hr (5%  $CO_2$ , 95% humidity, 37°C). AB reagent (10 µl of 500 µM resazurin sodium salt in PBS) was added and the cells were incubated for an additional 4 hr at 37°C. Fluorescence (extinction at 544 nm, emission at 590 nm) was determined on an Omega Fluostar (BMG Labtech) fluorescence plate reader. The  $IC_{50}$  values were determined with the Quest Graph $^{\text{TM}}$   $IC_{50}$  Calculator (AAT Bioquest Inc.).

### 4.2.5 | In vitro cytotoxicity assay

MTT assay was carried out for cytotoxicity evaluation of compounds. Briefly, Vero cells were cultured in 96-well plates ( $5 \times 10^3$  cells per well per 200 µl) for 24 hr in RPMI-1640 medium with 10% FBS and 5% CO<sub>2</sub> at 37°C. Cells were washed with PBS and treated with test compounds for 72 hr at varying concentrations (50, 25, 12.5, 6.25, 3.13, 1.65, and 0.75 µg/ml) in medium with 10% FBS. As a negative control, cells were treated with the medium in 2% FBS. Thereafter,

the supernatant was removed and 100 ml RPMI-1640 medium containing 10 ml MTT (5 mg/ml) was added and incubated for 4 hr. After that, the supernatant was removed and 200 ml DMSO was added to dissolve the formazan. FLUOstar OPTIMA spectrophotometer was applied for colorimetric analysis ( $\lambda$  = 540 nm). Cytotoxic effects were expressed by IC<sub>50</sub> values (concentration that caused a 50% reduction in viable cells). Obtained IC<sub>50</sub> values resulted from three independent experiments. [30,31]

#### **ACKNOWLEDGMENTS**

R.S. thanks the Deutsche Forschungsgemeinschaft for financial support (grant Scho 402/12-2). We are grateful to Qassim University and the Deanship of Scientific Research for material support of this study (number cosao-bs-2019-2-2-1-5619) during the academic year 1440 AH/2019 AD.
